

ENHANCING THE RV LIFESTYLE FEBRUARY 2024

Reace And Tranquility

DeFuniak Springs, Florida page 70

VOL. 61 NO. 2 • \$3.99 US FamilyRVingmag.com

THIS ARTICLE IS REPRINTED FROM THE FEBRUARY 2024 ISSUE

Knowing which vehicles are approved by their manufacturer for towing four wheels down, as well as what equipment will be required to do so, will save you time and provide a worry-free experience when you travel.

erhaps the best thing about

traveling by motorhome is the practically unlimited freedom it provides. Desert mesas, soaring redwoods, and pristine coastlines are all on the menu — and apart from timing based on reservations at a resort or a campground, you can keep your own schedule.

Bringing a towed (dinghy) vehicle along for your travels enhances the RV experience and can take your sightseeing to a new level. While the RV provides a comfortable and welcoming base camp, the right dinghy vehicle can serve as a willing scout vehicle. Drive winding mountain roads, visit rugged Bureau of Land Management (BLM) land, or even (gasp) find parking at the local outlet mall. Of course, you probably know all this, which is why you're reading this guide. But if you are buying your first towed vehicle, or perhaps the first new (or new-to-you) one in a long time, there are a lot of things to consider before making a purchase and embarking on your journeys.

The first is determining whether the vehicle you're contemplating is approved for dinghy towing (also known as recreational towing, four-down towing, flat towing, etc.) by the vehicle manufacturer. The accompanying guide lists all the 2024 vehicles we've been able to find that fit this criterion. Towing a vehicle that is approved is important, because the warranty applies to mechanical issues that may surface from doing so. Towing a vehicle that is not approved by the manufacturer means that you'll likely be on your own in the event of mechanical failure.

Always consult the vehicle owners manual and look in the index under "towing" or "recreational towing" to find out if the vehicle is indeed towable. Be sure to look for recreational towing information rather than emergency towing, because what may be possible for emergency purposes may not apply to ongoing recreational towing. Also check what steps will be required each time you prepare to tow. For example, some vehicles only need to have the steering wheel unlocked and the transmission shifted into neutral, while certain newer vehicles may require removing fuses and/or disconnecting the battery negative cable. Aftermarket products are available to make these latter steps as simple as flipping a switch (we'll get into those later), but they will, of course, add to your expenses.

Lastly, consider purchasing a used vehicle for dinghy duty. Older vehicles are not only less expensive, but they often require fewer steps to prepare them for towing. Also, remember that a towed vehicle will spend much of its time behind your motorhome, where it can be subjected to debris, wet road paint, or tar thrown back by your RV's tires. Products designed to protect the dinghy vehicle (read on for info) definitely can help, but they aren't foolproof. While no one wants to have their vehicle damaged, dings and scratches are a little easier to swallow if the vehicle isn't brand new.

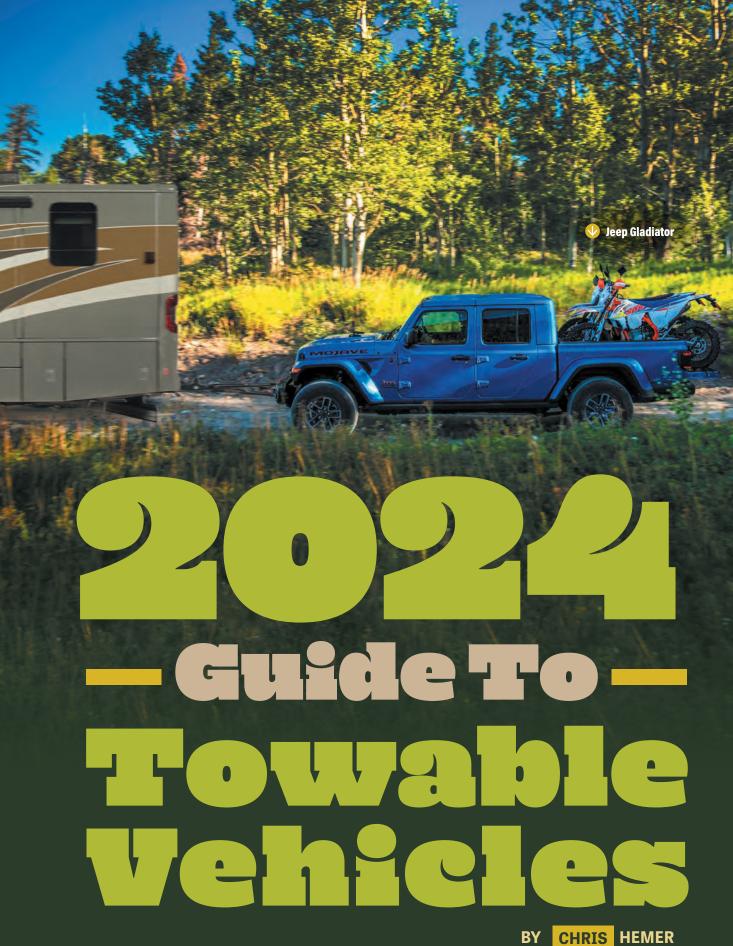

That all being said, let's get into exactly what you'll need to tow the dinghy of your choice safely and legally.

BASE PLATE

Think of your dinghy like a trailer. The base plate serves as the "hitch" that allows the vehicle to be attached to your motorhome with the help of a tow bar. In reality, a base plate isn't a plate at all; rather, it is a carefully engineered steel structure that bolts to the towed vehicle's frame and/or bumper brackets to distribute towing/braking loads evenly. But unlike a hitch, which can be used on a multitude of trailers, a base plate is designed specifically for the vehicle you plan to tow. So, the first step is to find out whether a base plate is available for the vehicle that interests you, which can be a challenge if it is a new model. The leading manufacturers of dinghy towing equipment (Blue Ox, Demco, and Roadmaster) all offer "fit lists" for their base plates and other equipment online, allowing you to simply enter the make, model, and year of your vehicle to find out whether a base plate is available for it. Pro Tip: Find out if a base plate is available for your vehicle before you make the purchase. The links are as follows:

Blue Ox: blueox.com/find-a-baseplate
Demco Products: demco-products.com/
rv-towing/baseplates

Roadmaster: fitmaster.roadmasterinc.com In addition, each company offers free downloads of their installation instructions, so you can get a clearer

picture of what's involved. While some base plates require only a few small brackets and fasteners that attach to the existing bumper brackets, others consist of a complex structure that may necessitate the removal of the vehicle's front fascia — along with trimming plastic, modifying air vents, etc. The difference in labor costs could be significant. You also should consider who might be doing the work for you. Is it an experienced RV shop with a great reputation, or the local mechanic who may have never done this sort of work before? Experienced, skilled technicians can make all the difference.

Finally, if you can't find a base plate for your vehicle, call the base plate manufacturer(s). It may be on their list of new products and not available yet.

TOW BAR

While the concept of a tow bar may seem simple, these products have come a long way since their advent in the 1970s. From a basic steel A-frame design likely fabricated in an RV shop, tow bars have continually evolved throughout the years. They now are available in a multitude of designs that make dinghy towing easier than ever. With that in mind, it's important to do some research to make sure you're purchasing the best possible tow bar for your needs and budget.

Let's start with the basics. In the interest of safety, all tow bars have weight ratings — the maximum amount of weight they are designed to manage. So, the first step is to determine how much your towed vehicle weighs when it is full of fuel and cargo. While all tow bars on the market today are rated for at least 5,000 pounds — which covers just about every passenger car and small/midsize SUV on the market — many RVers load camping gear and other supplies in the cargo area, which can add several hundred pounds to the vehicle's curb weight. You can easily find out the weight of your vehicle online and then perform a rough calculation of the weight you carry, or, better yet, take the vehicle to a public scale when it is full of fuel and supplies to find out for sure. In any case, it's not a bad idea to purchase a tow bar with capacity to spare, just to be on the safe side.

Not surprisingly, each tow bar manufacturer offers its own unique features and benefits, so shop carefully and determine what's important to you. For example, the bar's weight is a big consideration. Depending on the design, material(s), and rated capacity, tow bars can weigh 50 pounds or more, which is a lot to handle while bent over a hitch receiver. While it is true that the bar will spend most of its time mounted to either the towed

vehicle or the motorhome, there will be those instances when you'll have to remove it (for storage, theft prevention, etc.), so you'll probably want the lightest model possible.

Next, determine how the tow bar is stowed — on the towed vehicle (older designs) or on the motorhome and whether the bar is a traditional or a "nonbinding" design. Traditional tow bars may be less expensive, but they are more difficult to connect and can be nearly impossible to disconnect if you find yourself on uneven ground. Newer, nonbinding tow bars offer legs that move independently of one another so the dinghy doesn't have to be perfectly aligned with the motorhome when connecting. They also have latches that can be released to facilitate connecting/disconnecting.

Another benefit of nonbinding designs is that they don't use an old-fashioned ball-and-coupler (trailer hitch) configuration; the tow bar's shank goes into the motorhome's hitch receiver and stays there. When you're not using the tow bar, it simply folds up out of the way and stays on the motorhome. A bag is usually included to keep the tow bar assembly clean and dry.

Some tow bars offer integrated channel guides for the power cord and safety cables, which looks neater and prevents these critical components from dragging on the road. Always find out what is included with your tow bar, and what else may be required. For example, some companies offer complete kits that come with everything you need to tow, while others offer a variety of kits and individual components.

Finally, keep in mind that each equipment manufacturer engineers its products to work with other products in the same family. They aren't necessarily designed to work with a competitor's products; so, mixing and matching may not be a good idea. However, if the need arises, most manufacturers provide detail on mounting considerations and available solutions. For example, Blue Ox, Demco, and Roadmaster all offer adapters that make it possible to connect their tow bar to a competitor's base plate; you'll typically find these in the tow bar section of each company's website. When in doubt, always call and ask.

SUPPLEMENTAL BRAKING SYSTEM

Once again, let's use the travel trailer for comparison. Except for some very small tent trailers, all towable RVs come equipped with a braking system that activates when the towing vehicle's brakes are applied. This involves a small wiring harness that plugs into a receptacle next to the hitch receiver on the towing vehicle. The trailer receives an electrical signal when the driver applies the

2024 Guide To

Towable Vehicles

brakes, and a brake controller in the passenger compartment allows the driver to control how much braking is applied and when.

With a dinghy vehicle, it's not that simple. A passenger vehicle was never designed to be towed like a trailer, so there is no such wiring harness and, therefore, no way to apply its brakes during towing. A supplemental braking system is the solution, and they come in two different categories: portable and permanent.

Portable systems are less expensive than permanent ones and require only minutes to install. They're a good option if you tow more than one vehicle, or if you may be considering another dinghy vehicle soon and therefore don't want to commit to a permanently installed system. A portable system is installed between the driver's seat of the towed vehicle and the brake pedal, and it typically incorporates an arm and pedal clamp that depresses the brake pedal when the motorhome's brakes are applied. Features vary greatly in portables, but proportional

braking is one benefit that may influence which system you choose. "Proportional braking" means that the system in your dinghy is designed to mirror the brake application in the motorhome, both in timing and in the amount of force; as you brake harder, so does the dinghy brake system. Other (typically less expensive) systems use "on/off" braking, which can cause a perceptible jerking sensation when the brakes are applied.

Blue Ox, Brake Buddy, Demco, Roadmaster, and RVi all offer portable supplemental braking systems.

Permanent systems are a good option if you tow only one vehicle, and you plan to keep it a long time. These systems usually have a price tag that is comparable to some portable units, but because they may require substantial labor to install, the initial investment will likely be greater. The upside is that once installed, permanent systems remain in the vehicle and require very little preparation before towing — just plug in a power cord and/or quick disconnect and the system is operational.

Permanent units may tie into the air or hydraulic brake system of the motorhome, or use a combination of the brake signal and a sensor to determine how hard the brakes are being applied and activate the dinghy's brakes accordingly.

Finally, permanent systems are designed to be practically invisible, typically consisting of a small control unit that mounts underneath the hood or out of view in the passenger compartment.

Brake Buddy, Demco, Roadmaster, and RVi also offer permanently installed braking systems, as does M&G Brake Systems.

Another option is the ReadyBrake towed vehicle system from NSA RV Products, which is a hitch-mounted surge brake that provides proportional braking and is designed to fit any tow bar with a 2-inch hitch receiver.

A supplemental braking system, portable or permanent, will reduce braking distances, provide greater control when descending steep grades, and keep you compliant with towing laws in both the U.S. and Canada.

ELECTRICAL

Because your dinghy vehicle essentially qualifies as a trailer in the eyes of the law, it must have running lights, brake lights, and turn signals that operate in concert with the motorhome's lights. Years ago, one had to entrust this kind of work to a mechanic who would slice and dice wiring systems and fabricate a harness that would plug into the back of the motorhome to supply power — sometimes with mixed results. Today, ready-made kits enable an electrical connection to the motorhome in just a few hours. These can be divided into three basic types: prefabricated, application-specific harnesses that plug and/or splice into

the dinghy's electrical system; universal towed car wiring kits; and so-called bulb-and-socket systems.

Clearly, a prefabricated harness would be the easiest way to go — if one is available for your vehicle. Companies such as Blue Ox, Demco, and Hopkins Towing Solutions offer prefabricated kits, and their fit lists can help you find what's available.

If no prefabbed kits are offered for your vehicle, don't despair. A universal wiring kit can be made to fit almost any vehicle by splicing into the existing electrical system. Less common today are bulb-and-socket systems that bypass the vehicle's factory electrical system altogether with a dedicated wiring harness and separate bulb/socket assemblies that mount inside the existing taillight housings. Note that universal kits are typically less expensive to purchase initially, but they may require more labor to install, depending on the vehicle. All systems will include a wiring harness that is routed to a socket located at the front of the towed vehicle, where it can be plugged into the motorhome's power receptacle when you're ready to tow.

In some applications, wiring kits that utilize the towed vehicle's electrical system may also include one-way diodes to prevent electrical "back flow" from the motorhome's electrical system to the dinghy (and vice versa), as that could damage both vehicle systems. Companies such as Blue Ox, Demco, Hopkins Towing Solutions, and Roadmaster all offer viable choices and can help you find what you need for your specific vehicle.

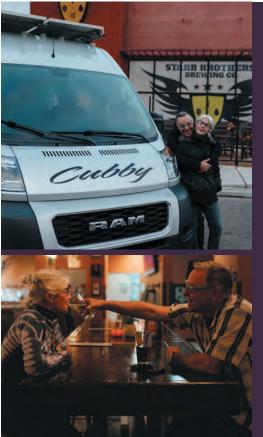

Another, simpler solution is to purchase an auxiliary light bar that attaches temporarily to the vehicle using suction cups or magnets — similar to what towing companies employ if they need to transport your vehicle. These may be an option if wiring kits for your vehicle are difficult to find and/or you don't want to modify the vehicle's electrical system. They may also be preferable if you tow your vehicle only occasionally, or if you tow several different vehicles from time to time. These kits incorporate a power cord that is routed across the towed vehicle to the connector at the motorhome's receiver — simply attach the assembly, plug it in, and go.

As newer vehicles come equipped with more sophisticated wiring systems, you may encounter electrical challenges that are difficult to solve, and/or make towing very inconvenient. In these instances, some specialized equipment may be required. As you peruse the accompanying dinghy guide, note that some manufacturers require that the negative battery cable be disconnected before towing and then reconnected afterward. This is not only a time-consuming hassle, but you'll also have to reset items such as the vehicle's clock and radio presets each time you tow. Roadmaster is one company that offers a battery disconnect kit that cuts power to

the towed vehicle's battery with the flip of a switch (usually located in the passenger compartment) yet still provides positive current to the emergency breakaway system or other accessories that must be connected to battery power.

Some vehicles may require that the ignition switch be left in the "accessory" position so that the steering wheel remains unlocked, but this activates the vehicle's electrical system and may result in a dead battery when you arrive at your destination. A useful solution here is to purchase a so-called charge line kit, which uses power from the motorhome to keep your vehicle's battery charged for the duration of your journey. Blue Ox, Demco, Roadmaster, RVi, and others offer charge line kits, and they're typically designed for universal fit.

Other new vehicles require that a fuse (or fuses) be removed each time you tow, which is an even bigger ordeal. For these applications, Blue Ox has fuse bypass switches available, while Roadmaster offers its

"MEMORIES THAT LAST A LIFETIME"

We have been members for three years now, and when we do camp at a Harvest Hosts site, we really enjoy it every time, We've been to wineries, vineyards, breweries, alpaca farms, museums, and distilleries and we've always enjoyed it. It's so much better than staying at a campground. You get to experience the real USA.

- Harvest Hosts Member, Sabine S.

SCAN THIS QR CODE TO DOWNLOAD OUR FREE RESOURCE "NATIONAL PARK RESERVATION

FuseMaster system — both solutions require only that you flip a switch to disconnect the fuse(s) in question.

Still other vehicles may have electrical systems that aren't compatible with the motorhome's for one reason or another, causing odd issues or a lack of function altogether. In most cases, an experienced RV repair center has already encountered these problems and will know what to do; failing that, contacting one of the reputable companies mentioned here will help you find a solution.

PROTECTION

As previously mentioned, life on the road can be rough for a dinghy vehicle. There's no way to predict the condition of the roads you'll be traveling on, and debris like rocks and gravel thrown back by the motorhome's tires can cause damage such as chipped paint and cracked windshields.

Fortunately, various products are available to protect your towed vehicle while it is in transit, and they often can be combined to form two or more layers of defense. The first step is to fit the motorhome with a rock guard, which typically attaches to the rear bumper of the coach and employs rubber or nylon strips that hang down just an inch or two from the road surface. The strips can be trimmed to achieve the correct fit and still allow some airflow to get back to the dinghy vehicle, which can be important (more on that in a minute). Rock guards are generally inexpensive, too, with many models costing \$150 or less.

Regardless of its implied intention, however, a rock guard won't stop all rocks — only those small enough to be deflected by the rubber/nylon strips. To prevent larger rocks or other debris from causing damage, consider a rock shield of some kind. These are designed to cover the

front of the vehicle and are made of polyethylene plastic, so they're lightweight yet tough. Blue Ox, Demco, and Roadmaster all offer their own designs, but check with the manufacturer of your choice to make sure the guard will fit with the equipment you already have. Rock shields typically mount to the base plate or tow bar and may not be interchangeable with all equipment brands.

Now for that important part about airflow. Some models approved by their manufacturers for dinghy towing have a special note in the owners manual that cautions against blocking airflow to the front of the vehicle. This is typically because these vehicles employ a transmission cooler that may not work effectively if it isn't exposed to a steady flow of air. Transmission overheating and damage could result. Be sure to check the owners manual carefully for any cautionary notes about rock shields or other devices that may prevent adequate airflow.

If your vehicle can't be fitted with a rock shield, there are still options. Roadmaster offers its Tow Defender, a vinyl-coated mesh screen that lays on top of the tow bar, preventing road debris from reaching the vehicle, yet leaving the grille uncovered. You might also consider 3M Scotchgard paint protection film, which must be professionally installed. It isn't cheap, but it can be used to cover all areas that may be subject to damage, including the hood and fenders. Learn more at bit.ly/ 3Mpaintprotection. Another option is Diamond Shield paint protection film (diamond-shield.com).

We know, it's a lot to think about, and the investment can be considerable. But with a properly outfitted and protected towed vehicle, you'll enjoy worry-free travels for years to come.

BUICK

MAKE/MODEL	BASE CURB WEIGHT (POUNDS)	SPEED AND DISTANCE LIMITS	TOWABLE WITH MANUAL TRANSMISSION?	TOWABLE WITH AUTOMATIC TRANSMISSION?	OVERALL LENGTH (INCHES)
Encore GX AWD	3,256 lbs.	70 mph	N/A	Yes	171.4 in.

MANUFACTURER'S INSTRUCTIONS (SEE OWNERS MANUAL FOR DETAILS)

Encore GX AWD: Before towing, disconnect negative battery post. Cover with a non-conductive material to prevent any contact with the negative battery terminal.

CADILLAC

MAKE/MODEL	BASE CURB WEIGHT (POUNDS)	SPEED AND DISTANCE LIMITS	TOWABLE WITH MANUAL TRANSMISSION?	TOWABLE WITH AUTOMATIC TRANSMISSION?	OVERALL LENGTH (INCHES)

Tahoe 4WD	5,661 lbs.	None	N/A	Yes	210.7 in.
Trailblazer AWD	3,252 lbs.	70 mph/None	N/A	Yes	173.5 in.
Trax FWD	3,062 lbs.	70 mph/None	N/A	Yes	178.6 in.

MANUFACTURER'S INSTRUCTIONS (SEE OWNERS MANUAL FOR DETAILS)

Blazer AWD/FWD: Disconnect negative battery terminal before towing. Vehicle should be run at the beginning of each day and at each RV fuel stop for about five minutes to ensure proper lubrication of transmission components.

Colorado 4WD: Only dinghy tow four-wheel-drive vehicles with a two-speed transfer case that has an N (neutral) position and a 4L (four-wheel-drive low) setting. Negative battery cable must be disconnected. Cover the negative battery post and cable with a non-conductive material.

Equinox AWD/FWD: Vehicle should be run at the beginning of each day and at each RV fuel stop for about five minutes to ensure proper lubrication of transmission components. The battery of the towed vehicle must be charged during recreational vehicle towing.

Silverado 1500 4WD: Only dinghy tow four-wheel-drive vehicles with a two-speed transfer case that has an N (neutral) and a 4L (four-wheel-drive low) setting. Disconnect the negative battery cable and cover it and the post with a non-conductive material.

Silverado 2500/3500 HD 4WD: Only dinghy tow four-wheel-drive vehicles with a two-speed transfer case that has an N (neutral) and a 4L (four-wheel-drive low) setting. Disconnect the negative battery cable and cover it and the post with a non-conductive material.

Suburban 4WD: Only dinghy tow four-wheel-drive vehicles with a two-speed transfer case that has an N (neutral) and a 4L (four-wheel-drive low) setting. Disconnect the negative battery cable and cover it and the post with a non-conductive material.

Tahoe 4WD: Only dinghy tow four-wheel-drive vehicles that have an N (neutral) and a 4L (four-wheel-drive low) setting. Shift the transfer case to N (neutral), transmission to P (park). Disconnect the negative battery cable and secure the nut and bolt. Cover the negative battery post with a non-conductive material to prevent any contact with the negative battery terminal. Trailblazer AWD: Disconnect the negative battery terminal. Cover the negative battery post with a non-conductive material to prevent any contact with the negative battery terminal.

Trax FWD: Shift transmission into neutral and turn vehicle off. Disconnect the negative battery terminal and cover the negative battery post with a non-conductive material to avoid contact with the negative battery terminal.

FORD

MAKE/MODEL	BASE CURB WEIGHT (POUNDS)	SPEED AND DISTANCE LIMITS	TOWABLE WITH MANUAL TRANSMISSION?	TOWABLE WITH AUTOMATIC TRANSMISSION?	OVERALL LENGTH (INCHES)
Bronco	4,319 lbs.	None	Yes	Yes	173.7 in.

Maverick Hybrid FWD	3,674 lbs.	70 mph/None	N/A	Yes	199.7 in.

MANUFACTURER'S INSTRUCTIONS (SEE OWNERS MANUAL FOR DETAILS)

Bronco: Do not disconnect battery while towing. Transfer case in neutral. Switch vehicle to accessory mode. Press the 2H button on the four-wheel-drive mode control. Press and hold brake pedal and shift transmission to the neutral position (automatic) or leave the gearshift lever in the neutral position and fully press and hold both the clutch and the brake pedal (manual). Using the instrument cluster controls on the steering wheel, select Settings. Select Neutral Tow. See owners manual for additional information.

Edge ST: Use the Manual Park Release procedure outlined in owners manual.

Escape Hybrid/Plug-In Hybrid: Switch vehicle on in accessory mode. Select Neutral Tow from Settings in the information display main menu. Follow instructions on the information display. Put your climate control system in recirculated air mode to prevent exhaust fumes from entering the vehicle.

Expedition/Expedition MAX 4WD: Do not disconnect negative battery cable. Press the 2H button on the four-wheel-drive mode control. Place vehicle in temporary neutral mode. See owners manual for complete details. Put climate control system in recirculated air mode to prevent exhaust fumes from entering the vehicle.

F-150 4WD: Start vehicle. Press the 2H button on the four-wheel-drive mode control. Place vehicle in temporary neutral mode. See owners manual for additional details. Do not disconnect battery while towing.

F-150 Raptor: Start vehicle. Press the 2H button on the four-wheel-drive mode control. Place vehicle in temporary neutral mode. See owners manual for additional details. Do not disconnect battery while towing.

F-250/F-350/F-450 Super Duty 4WD: Do not disconnect the negative battery cable. Put climate control system in recirculated air mode to prevent exhaust furnes from entering vehicle. Press the 2H button on the four-wheel-drive mode control. Select Neutral Tow. See owners manual for complete details.

Maverick Hybrid FWD: Put climate control system in recirculated air mode to prevent exhaust fumes from entering vehicle. Select Settings from the instrument display main menu. Select Neutral Tow. Follow instructions on instrument cluster display. Start your vehicle at the beginning of each day, and every six hours or fewer. Before continuing to tow, switch Neutral Tow on and keep the vehicle on for three minutes.

Jeep Grand Cherokee

GMC

MAKE/MODEL	BASE CURB WEIGHT (POUNDS)	SPEED AND DISTANCE LIMITS	TOWABLE WITH MANUAL TRANSMISSION?	TOWABLE WITH AUTOMATIC TRANSMISSION?	OVERALL LENGTH (INCHES)
Canyon 4WD	4,670 lbs.	None	N/A	Yes	213.2 in.
